PROFESSIONAL SUMMARY

Software Engineer with 2+ years of experience building scalable, customer-centric web applications using React, TypeScript, and modern frontend architectures. Specialized in designing AI-powered developer tooling — including a custom GitHub Copilot-based VS Code agent — that automates test generation and accelerates engineering workflows. Adept at integrating LLM APIs (GitHub Copilot, ChatGPT/OpenAI) to build intelligent, production-ready UI and internal tools.

WORK EXPERIENCE

Tavant — Software Engineer

July 2024 – Present | Noida, India

TRIALWYZE (Current Project)

- Driving full-stack frontend development across the entire application, transforming complex business requirements into high-performance, intuitive user workflows.
- Architecting a centralized, modular UI library using React and TypeScript, accelerating feature delivery across modules and cutting duplicate component code by 85%.
- Designed and built a custom VS Code AI agent extension on Enterprise GitHub Copilot that hooks into core editor lifecycle events (file save, diff, focus change) to detect state changes in real time and auto-generate unit test scaffolding — cutting manual test-writing time by 85% across the team.
- Engineered the agent's prompt pipeline to parse function signatures, branching logic, and existing test patterns, then chain multiple LLM calls to produce edge-case-aware assertions rather than boilerplate happy-path tests.
- Built a validation loop that runs each AI-generated test against the local build/lint pipeline before surfacing it to the developer, filtering out non-compiling or low-confidence suggestions and improving team trust/adoption of the tool.
- Drove internal adoption of the AI agent through demos and documentation, reaching 75% usage among the Trialwyze engineering team within 2 weeks.
- Engineered frontend business logic and state management strategies, ensuring data integrity and seamless integration with complex backend APIs.
- Implemented error boundary systems and validation logic to improve application resilience.

Digital-Ag & NutriSolutions

- Boosted application reliability by authoring 30+ Jest unit and integration tests, using LLM prompt engineering to generate diverse edge cases and maintain 85%+ code coverage.
- Refactored legacy Angular components to align with modern design standards, improving UI responsiveness and maintainability.
- Collaborated with UX designers and PMs to resolve critical functional bugs and UI inconsistencies in high-traffic production environments.

TECHNICAL PROJECTS

Mayo Clinic STRIP AI — Deep Learning Research

- Developed a deep learning classification model in Python to analyze 395GB of pathological image data, achieving 89.6% diagnostic accuracy.
- Applied generative data augmentation techniques to address data scarcity and improve model generalization during training.
- Co-authored published research on automated blood clot origin identification to assist in stroke diagnosis.

TECHNICAL SKILLS

AI & Agentic Tooling: GitHub Copilot (agent/extension dev), ChatGPT/OpenAI API integration, LLM prompt engineering, prompt chaining, LLM-based code & test generation

Languages: TypeScript, JavaScript (ES6+), HTML5, CSS3, Python

Frontend: React.js, Angular, Redux, Material UI, Tailwind CSS, Bootstrap 5

Tools & Testing: Node.js, Jest, React Testing Library, Git, Vite, RESTful APIs, Agile/Scrum

CERTIFICATIONS

Google AI Professional Certificate — Coursera

2024

7-course program covering AI app building, data analysis, and prompting

EDUCATION

Jaypee Institute of Information Technology

Bachelor of Technology in Computer Science

2024 | Noida, India
